Water is the basis for a healthy pond

Pure water is the basis for a healthy pond environment. Water has a direct influence on aquatic plant growth, the development of micro-organisms and the condition of the fish. A clear pond with healthy fish and beautiful plants . . . that is a wish of every pond lover! If all water values are at level and the micro-life is all right, it is a matter of biological equilibrium in the pond. As the composition of the pond water may fluctuate, it is advisable to measure the water values regularly. If you have an insight into the quality of the water, you can solve or prevent any pond problem. Velda brings relief with products to improve the water quality.

Measure to be sure

Ponds may have to contend with problems. By measuring the water values regularly, the cause of the problem becomes clear. Using the professional tests from Velda, all water values can be determined quickly and accurately. A convenient tool is the **Pond Test App** for smartphone or tablet. The app uses the values for a complete diagnosis and history of your pond. You will receive smart advice from Velda to maintain water quality and avoid any pond problems. Saving the test results, enables you to follow the developments of the pond environment.

GH *increase the general hardness with GH Plus because a ideal between 8 - 12 °DH too low GH will slow down the plant growth*

KH *increase the carbonate hardness with KH Plus because a ideal between 6 - 8 °DH too low KH indicates acidification of the pond*

pH *decrease the acidity with pH Min because a ideal between 7 - 8,5 pH too high pH will slow down the plant growth*

NO₂ *refresh part of the pond water and add Bacterial maximum 0.2 mg/l because too much nitrite is harmful for your fish*

NO₃ *replace the filter materials and apply more water plants maximum 25 mg/l because too much nitrate will cause algal growth*

NH₃/4 *replace the filter materials and remove bottom sludge maximum 0.2 mg/l because ammonia is dangerous for fish*
